

Lake and Pond Cleaning Services: Muck, Silt, and Sludge Removal

The Muck DoctorSM provides lake and pond cleaning and restoration services to the southeastern United States. Our innovative pond cleaning process removes sediment or muck from a lake or pond bottom. Sediment accumulates in the pond as part of the natural aging cycle.

We also service koi ponds and backyard ponds in the Metro Atlanta Area. The Muck Doctor's environmentally friendly process removes the built up

sediment and built up toxins and restores a pond to a healthy condition.

Our process is superior because:

- No chemicals are used
- The pond is returned to a healthy state
- Safe for pond liners
- Aquatic plants are not harmed
- Built up toxins are removed

Signs of an unhealthy pond

- Large spike in aquatic plants and/or algae blooms
- Foul smelling water
- Fish kills
- Fish gulping air at water surface
- Large mosquito populations
- Clogged drain pipes
- Green water color

The Muck DoctorSM Process Restores Your Pond's Health

Backyard ponds are a great addition to any landscape, but maintenance is required to retain their beauty. Ponds start filling with debris when constructed. The debris accumulating in the deeper portions of the pond does not decompose quickly enough. This produces harmful gases and accelerates algae growth that depletes the oxygen. Aerators can slow this process, but the muck will produce harmful toxins that could harm or kill your fish stocks.

When should I clean my pond?

As a general rule, you should completely drain and refill your pond yearly. This may not be frequent enough for ponds near or under large numbers of trees.

(Pressure washing the waterfall)

Many pond owners find that semi-annual service is a better solution for their pond. Spring and autumn are the best times, but any 6 month period will work to enhance the health and beauty of your pond.

The removed sediments are rich in organic materials. After drying, they can be spread as fertilizer or used as fill.

The Muck DoctorSM Pond Cleaning Process Produces Results

Remove the muck and you will enjoy:

- Improved water quality and clarity
- Thriving aquatic life
- Improved fishery (size and numbers)
- Unclogged bottom drains
- Reduced accumulated bacteria
- Eliminated smells from toxic gases, ammonias and algae
- Fewer mosquitoes

Once cleaned, the sediment buildup process can be slowed by aerators and sun blocking dyes. Ask your Muck Doctor representative about our post-cleaning recommendations.

Call Muck DoctorSM to Get Started

Give us a call. We will provide a quote to remove the built up "muck" and restore the pond's natural, healthy state. Our services include:

- Removal of potted aquatic plants
- Leaf and debris removal
- Draining of the pond
- Pressure washing of all below water surfaces.
- Re-pump out of loosened debris and sediment
- Filling of pond
- Check out filters and pumps
